I don't think so. But they would be from the same stage of water useage. I think they are generally taken from the sink in building 55. It's probably a matter of semantics though. Based on what I was told the only thing that happens to the water between the reservoir and the tank, before serving it to building 55 and others throughout the distribution area is chlorination. The levels of PCE in samples we collected from the reservoir and building 55 were very comparable.

Yes. Are those from the reservoir?

Phil: as we discussed, here are detections of PCE in the U.S. Census Bureau water system back to 1993. Let me know that you received these and if you have any questions.
